Infigratinib & Vosoritide: how to get them

For the Fetal Medicine appointment, Auckland City Hospital · Mon 2 Nov 2026, 1:00pm NZDT · Achondroplasia suspected, **not confirmed**

1 · Infigratinib: best pathway ORAL · DAILY

Once-daily tablet (mini-tablets for infants). FGFR1–3 tyrosine kinase inhibitor, made by BridgeBio / QED Therapeutics. Growth: **about 1.7–2.5 cm/yr extra** (PROPEL 3: +1.74 cm/yr vs placebo; PROPEL 2: +2.50 cm/yr over baseline). **Not approved anywhere yet**. FDA priority review decision due **4 Feb 2027**, EU filing planned. No achondroplasia brand name yet. *Truseltiq* was a withdrawn cancer product and is not this medicine.

1. **Best: PROPEL Infant & Toddler trial** (NCT07169279, ages 0–32 months). Recruiting at Murdoch Children's Research Institute, Melbourne (+61 3 8341 6200). No NZ site, so expect travel to Melbourne for visits and a possible placebo phase.

> **Can a baby with only a prenatal suspicion enrol? No.** The trial requires a **diagnosis confirmed by genetic testing** (a lab report naming the mutation), and the baby must be born at ≥37 weeks and ≥2.5 kg. The plan is to **get a referral lined up now**, confirm with an FGFR3 test at or after birth, then go to screening. Babies who have had **any prior achondroplasia drug, including vosoritide, are excluded**.

2. **BridgeBio expanded access:** the doctor emails medinfo@bridgebio.com. It's case-by-case, the published policy is US-only, and it's unlikely while a trial is open.
3. **Section 29 (Medsafe):** an NZ specialist can prescribe and import it, but only once it's on sale overseas (Feb 2027 at the earliest). Self-funded.
4. **Pharmac NPPA:** prescriber applies on 0800 660 050 (option 2). Exceptional cases only, so expect it to be hard.

2 · Vosoritide (Voxzogo, BioMarin) INJECTION · DAILY

Daily injection under the skin. CNP analogue. **+1.57 cm/yr** vs placebo, backed by years of extension and real-world data. Approved in the US (from birth), EU (from 4 months), Japan and Australia. Common side effects: injection-site reactions and low blood pressure. **Not Medsafe approved or Pharmac funded** as far as we found.

- **Route:** a Starship paediatric endocrinologist prescribes it as an unapproved medicine under **Section 29**, and a pharmacy imports it. Self-funded unless a **Pharmac NPPA** named-patient application is approved, which is hard to get. **Cost guide:** about A$330k/yr at Australian list price before PBS funding.
- **Who applies:** the specialist, not you. **Paperwork:** confirmed FGFR3 genetic report, clinic letters, baseline length, MRI and sleep study.
- **Timeline:** genetic result days to weeks after birth, then the application and import take weeks. **Choose one route:** starting vosoritide rules out the infigratinib trial.

3 · Ask at 1pm (tick as you go)

- [ ] Will you refer us now to the PROPEL Infant & Toddler trial at MCRI Melbourne?
- [ ] Can you start lining up a vosoritide Section 29 / NPPA application as plan B?
- [ ] Should we have amniocentesis for an FGFR3 test now, or test at birth? What are the risks, and how soon are results back?
- [ ] What could this be besides achondroplasia, and what would change the plan?
- [ ] Newborn checks: when will the MRI (foramen magnum) and sleep study be done?
- [ ] Can you refer us for a NASC disability support assessment?
- [ ] Who at Starship paediatric endocrinology will lead this, and can we meet them before birth?
- [ ] Trial first or vosoritide first, given the trial excludes treated babies?
- [ ] Can you refer us to Genetic Health Service NZ today?
- [ ] Birth plan: where, when and how? (The trial needs ≥37 weeks and ≥2.5 kg.)
- [ ] Who can help with the paperwork and costs of travelling to Melbourne?
- [ ] Can you write a letter to support a Child Disability Allowance application?

⚠ **Safety:** no medicine works or is given before birth. Treatment starts only **after birth and genetic confirmation**. Never use both drugs at once, and remember that starting vosoritide could rule out the infigratinib trial.
