How tall might our boy grow?

Adult height with and without treatment — boys with achondroplasia

UNTREATED

131 cm

4′4″ · usual range 120–142

VOSORITIDE

~151–157 cm

+20 to 26 cm · 4′11″–5′2″

INFIGRATINIB

~152 cm

+21 cm · best case up to ~170

Both add roughly 20–26 cm on current evidence.
Infigratinib might add more, but that's unproven.

- Trial averages — not a prediction for our son.
- Achondroplasia is not yet confirmed.
- Nobody has reached adult height on either drug yet; starting earlier likely helps more.
